Filter calibration: 95% Gaussian-ellipsoid coverage

N = 128 · 50 time steps · resample when ESS < N/2 · whiskers are 95% intervals across 10 observation sequences

Dark vertical line = nominal 95%. Each panel has its own x range; bearing coverage spans 0–100%.

Source: filter_summary.csv. Fast methods: 10 sequences × 10 PF seeds; OT/Gumbel: 10 sequences × 1 seed. Means condition on successful trials (PFJAX MVN on UNGM: 7% numerical failures). Coverage is a Gaussian-ellipsoid diagnostic, not exact credible-set coverage for multimodal posteriors.
