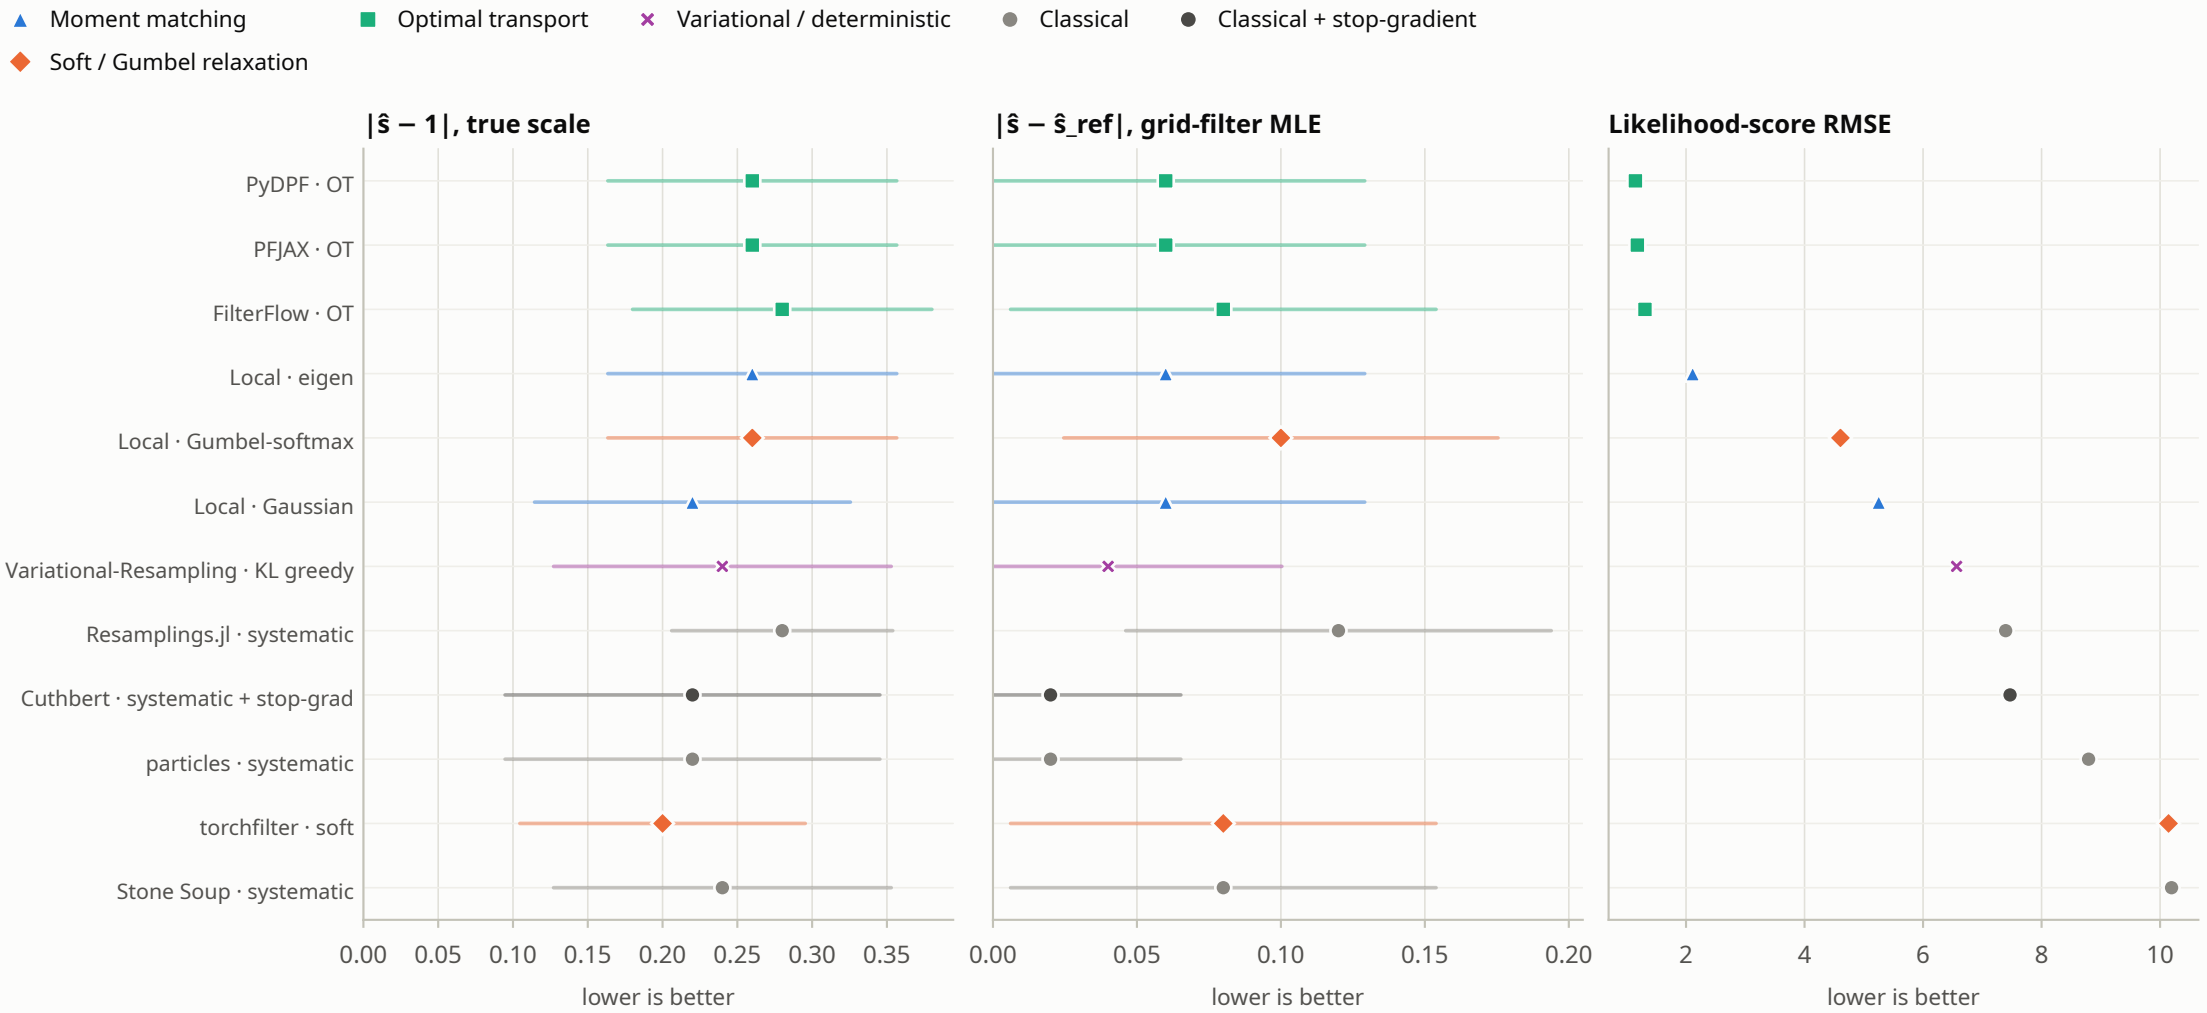
Stochastic-volatility observation-scale learning

N = 128 · 10 datasets · scale chosen on the grid {0.6, 0.8, 1.0, 1.2, 1.4} · rows sorted by score RMSE · whiskers are 95% intervals



Source: learning_summary.csv. Coarse-grid estimates, not optimiser convergence. Score = central difference in log s (step 0.01) against a 1001-cell numerical grid-filter reference, which is itself approximate.
